

GUI vs CLI

The difference between a GUI and CLI can be described simply as “convenience vs efficiency.” For example, a GUI (Graphical User Interface) is more convenient due to the fact it is visual and interactive. You are able to create folders, drag folders into other folders, and simply point and click. While a GUI is convenient and designed to be friendly for users, a CLI is considered the more “efficient” option.

A CLI (Command Line Interface) uses exclusively text to manage your desktop. Using certain commands, you may create new files, rename files, and even delete them quicker than you could using a GUI. However, what a CLI brings in efficiency, it sacrifices in convenience. You would need to memorize all of the commands to navigate your computer, not to mention that it isn't visual which can be confusing for some users.
